## I-1. Package Contents

**2**

**3**

**5**

**1.** Access Point

**4.** Quick Installation Guide

**2.** Ceiling Mount Bracket

**5.** Power Adapter

**3.** T-Rail Mounting Kit &  
Screws

## I-2. System Requirements

- Existing cable/DSL modem & router
- Computer with Web browser for access point configuration

## I-3. Hardware Overview

Ethernet Port      Power Jack (DC IN)

## I-4. LED Status

LED Color	LED Status	Description
Blue	On	The access point is on.
Amber	Flashing	Error.
Off	Off	The access point is off.

#### I-4. Reset

If you experience problems with your access point, you can reset the device back to its factory settings. This resets **all** settings back to default.

1. Press and hold the Reset button on the access point for at least 10 seconds, then release the button.

***You may need to use a pin or similar sharp object to push the reset button.***

2. Wait for the access point to restart. The access point is ready for setup when the LED is **Purple**.

## I-5. Safety Information

In order to ensure the safe operation of the device and its users, read and act in accordance with the following safety instructions.

1. The access point is designed for indoor use only; do not place the access point outdoors.
2. Do not place the access point in or near hot/humid places, such as a kitchen or bathroom.
3. Do not pull any connected cable with force; carefully disconnect it from the access point.
4. Handle the access point with care. Accidental damage will void the warranty of the access point.
5. The device contains small parts which are a danger to small children under 3 years of age. Please keep the access point out of reach of children.
6. Do not place the access point on paper, cloth or other flammable materials. The access point may become hot during use.
7. There are no user-serviceable parts inside the access point. If you experience problems with the access point, contact your dealer of purchase and ask for help.
8. The access point is an electrical device and as such, if it becomes wet for any reason, do not attempt to touch it without switching the power supply off. Contact an experienced electrical technician for further help.
9. If you smell something burning or see smoke coming from the access point or power adapter, disconnect the access point and power adapter immediately, as much as it is safely possible to do so. Call your dealer of purchase for help.

## II. Quick Setup

---

Your access point can be up and running in just a few minutes. This quick installation guide will help you set up your access point and direct you to the initial settings screens. Follow the instructions in the chapters below.

### II-1. Initial Setup

1. Connect the access point to a computer via Ethernet cable.
2. Connect the power adapter to the access point's 12VDC port and plug the power adapter into a power supply using the included cable.

3. Wait a moment for the access point to start up. The access point is ready when the LED is **Purple**.
4. Set your computer's IP address to **192.168.2.x** where **x** is a number in the range **3 – 100**. If you are unsure how to do this, refer to Section II-2 Basic Settings.

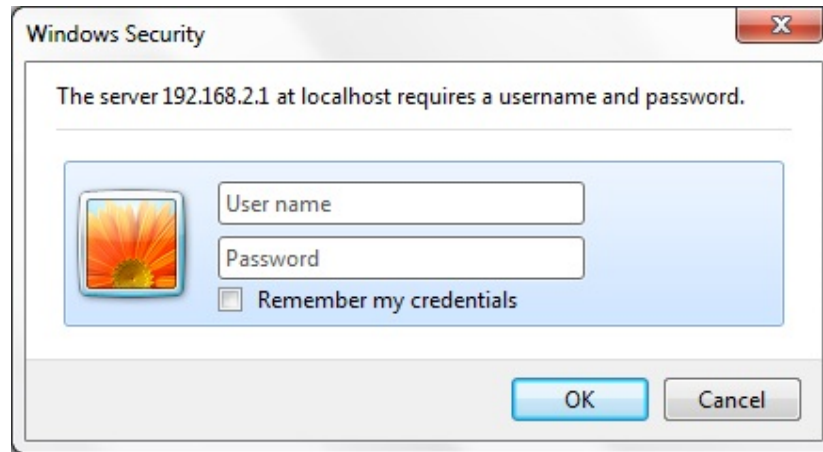

***Ensure there are no other active network connections on your computer (disconnect Wi-Fi connections and Ethernet cables).***

5. Enter the access point's default IP address **192.168.2.1** into the URL bar of a Web browser.

6. You will be prompted for a username and password. Enter the default username “admin” and the default password “1234.”

7. You will arrive at the System Information screen shown below.

The screenshot shows the Intellinet Network Solutions web interface. At the top is the Intellinet logo and a navigation bar with links: Home, Logout, and a language dropdown set to "Global (English)". Below the navigation bar is a main menu with tabs: "525688", "Information" (highlighted in orange), "Network Settings", "Wireless Settings", "Management", and "Advanced". On the left side, under the "Information" tab, there is a sidebar with links: "System Information" (highlighted with a checkmark), "Wireless Clients", "Wireless Monitor", and "Log". The main content area is titled "System Information" and contains a table with system details.

System	
Model	525688
Product Name	AP801F0275EEF0
Uptime	3 days 00:21:15
Boot from	Internal memory
Version	1.0.4
MAC Address	80:1F:02:75:EE:F0
Management VLAN ID	1
IP Address	10.10.11.221
Default Gateway	10.10.8.1
DNS	10.10.8.10 10.10.8.2
DHCP Server	--

8. Next, follow the instructions below in **II-2. Basic Settings** to configure the access point’s basic settings.

***For more advanced configurations, refer to IV. Browser Based Configuration Interface.***

## II-2. Basic Settings

The instructions below will help you to configure these basic settings of the access point:

- **LAN IP Address**
- **2.4GHz & 5GHz SSID & Security**
- **Administrator Name & Password**
- **Time & Date**

***It is recommended that you configure these settings before using the access point.***

1. To change the access point's LAN IP address, go to **“Network Settings” > “LAN-side IP Address”** and you will see the screen below.

LAN-side IP Address	
IP Address Assignment	DHCP Client
IP Address	10.10.11.221
Subnet Mask	255.255.252.0
Default Gateway	From DHCP 10.10.8.1

LAN-side DNS Servers	
Primary Address	From DHCP 10.10.8.10
Secondary Address	User-Defined 10.10.8.2

2. Enter the IP address settings you wish to use for your access point. You can use a dynamic (DHCP) or static IP address, depending on your network environment. Click “Apply” to save the changes and wait a few moments for the access point to reload.

***When you change your access point's IP address, you need to use the new IP address to access the browser-based configuration interface instead of the default IP 192.168.2.1.***

3. To change the SSID of your access point's 2.4GHz wireless network(s), go to **"Wireless Settings" > "2.4GHz 11bgn" > "Basic."** Enter the new SSID for your 2.4GHz wireless network in the "SSID1" field and click "Apply."

***To utilize multiple 2.4GHz SSIDs, open the drop-down menu labeled "Enable SSID number" and select how many SSIDs you require. Then enter a new SSID in the corresponding numbered fields below and click "Apply."***

2.4 GHz Basic Settings	
Wireless	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Band	11b/g/n
Enable SSID number	1
SSID1	ICU-WLS2 <span>VLAN ID 1</span>
Auto Channel	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Auto Channel Range	Ch 1 - 11
Auto Channel Interval	Two days <input type="checkbox"/> Change channel even if clients are connected
Channel Bandwidth	Auto
B SS BasicRateSet	1,2,5,5,11 Mbps

4. To configure the security of your access point's 2.4GHz wireless network(s), go to **"Wireless Setting" > "2.4GHz 11bgn" > "Security."** Select an "Authentication Method" and enter a "Pre-shared Key" or "Encryption Key" depending on your preference, then click "Apply."

***If using multiple SSIDs, specify which SSID to configure using the "SSID" drop-down menu.***

2.4 GHz Wireless Security Settings	
SSID	ICU-WLS2
Broadcast SSID	Enable
Wireless Client Isolation	Disable
Load Balancing	50 /50
Authentication Method	WPA-EAP
WPA Type	WPA2-EAP
Encryption Type	AES
Key Renewal Interval	60 minute(s)
Additional Authentication	No additional authentication

5. Go to **“Wireless Setting” > “5GHz 11ac 11an”** and repeat steps 3 & 4 for the access point’s 5GHz wireless network.
6. To change the administrator name and password for the browser-based configuration interface, go to **“Management” > “Admin.”**

Account to Manage This Device	
Administrator Name	<input type="text" value="admin"/>
Administrator Password	<input type="password" value="•••••"/> (4-32 Characters)
	<input type="password" value="•••••"/> (Confirm)

7. Complete the “Administrator Name” and “Administrator Password” fields and click “Apply.”

8. To set the correct time for your access point, go to “**Management**” > “**Date and Time.**”

Date and Time Settings						
Local Time	2015	Year	Mar	Month	26	Day
	8	Hours	19	Minutes	21	Seconds
<button>Acquire Current Time from Your PC</button>						

NTP Time Server	
Use NTP	<input checked="" type="checkbox"/> Enable
Server Name	pool.ntp.org
Update Interval	1 (Hours)

Time Zone	
Time Zone	(GMT-05:00) Eastern Time (US & Canada)

9. Set the correct time and time zone for your access point using the drop-down menus. The access point also supports NTP (Network Time Protocol) so alternatively you can enter the host name or IP address of a time server. Click “Apply” when you are finished.

***You can use the “Acquire Current Time from your PC” button if you wish to set the access point to the same time as your PC.***

10. The basic settings of your access point are now configured. Refer to **III. Hardware Installation** for guidance on connecting your access point to a router or PoE switch.

### III. Hardware Installation

---

#### III-1. Connecting the access point to a router or PoE switch

1. If you need to, remove the cap from the underside of the access point. This creates extra space for your cables to pass through.

2. Connect a router or PoE switch to the access point's **LAN** port using an Ethernet cable.

3. If you are using a router, connect the power adapter to the access point's 12VDC port and plug the power adapter into a power supply.

***Do not use the power adapter if you are using a PoE switch.***

### III-2. Mounting the access point to a ceiling

To mount the access point to a ceiling, follow the instructions below and refer to diagrams **A** & **B**.

#### **For Wooden Ceilings (refer to diagram A):**

- 1.** Place the ceiling mount bracket in the desired position and insert screw **iii** through hole **i** (x 2) and tighten to fix the bracket in place.
- 2.** When the ceiling bracket is in place, inset screw **iv** into hole **v** (x 2) on the access point.
- 3.** Fix the access point to the ceiling bracket by inserting the enclosed screws **iv** into holes **vi** and twisting the access point.
- 4.** Lock the access point firmly in place by twisting it to align screws **iv** with the grooves in the ceiling mount.

#### **For Other Ceilings (refer to diagram B):**

- 1.** Place the ceiling mount bracket in the desired position and insert screw **ii** through hole **i** (x 2) and tighten to fix the bracket in place, as shown in **A**.
- 2.** Insert screw **iii** through hole **i** and into anchor **ii** and tighten to provide additional strength.
- 3.** When the ceiling bracket is in place, insert screw **iv** into hole **v** (x 2) on the access point.
- 4.** Fix the access point to the ceiling bracket by inserting the attached screws **iv** into hole **vi** and twisting the access point.
- 5.** Lock the access point firmly in place by twisting it to align screws **iv** with the grooves in the ceiling mount.

**A**

**B**

### III-3. T-Rail Mount

To mount the access point to a T-rail, follow the instructions below and refer to diagram **C**, **D** & **E**.

1. Select the correct size T-rail bracket from the two sizes included in the package.
2. Attach the T-rail bracket **i** to hole **ii** using screw **iii** (x 2) as shown in **C**.

***If you need more space between the access point and the T-rail, use bracket **iv** between bracket **i** and hole **ii** (x 2), and use the longer screws (x 2) included in the package.***

3. Clip the access point onto your T-rail using the now attached T-rail bracket.

**D**

**E**

## IV. Browser-Based Configuration Interface

The browser-based configuration interface enables you to configure the access point's advanced features. The device features a range of advanced functions, such as MAC filtering, MAC RADIUS authentication, VLAN configurations, up to 32 SSIDs and many more. To access the browser-based configuration interface:

1. Connect a computer to your access point using an Ethernet cable.
2. Enter your access point's IP address in the URL bar of a Web browser. The access point's default IP address is **192.168.2.1**.
3. You will be prompted for a username and password. The default username is "admin" and the default password is "1234," though it was recommended that you change the password during setup (see **II-2. Basic Settings**).

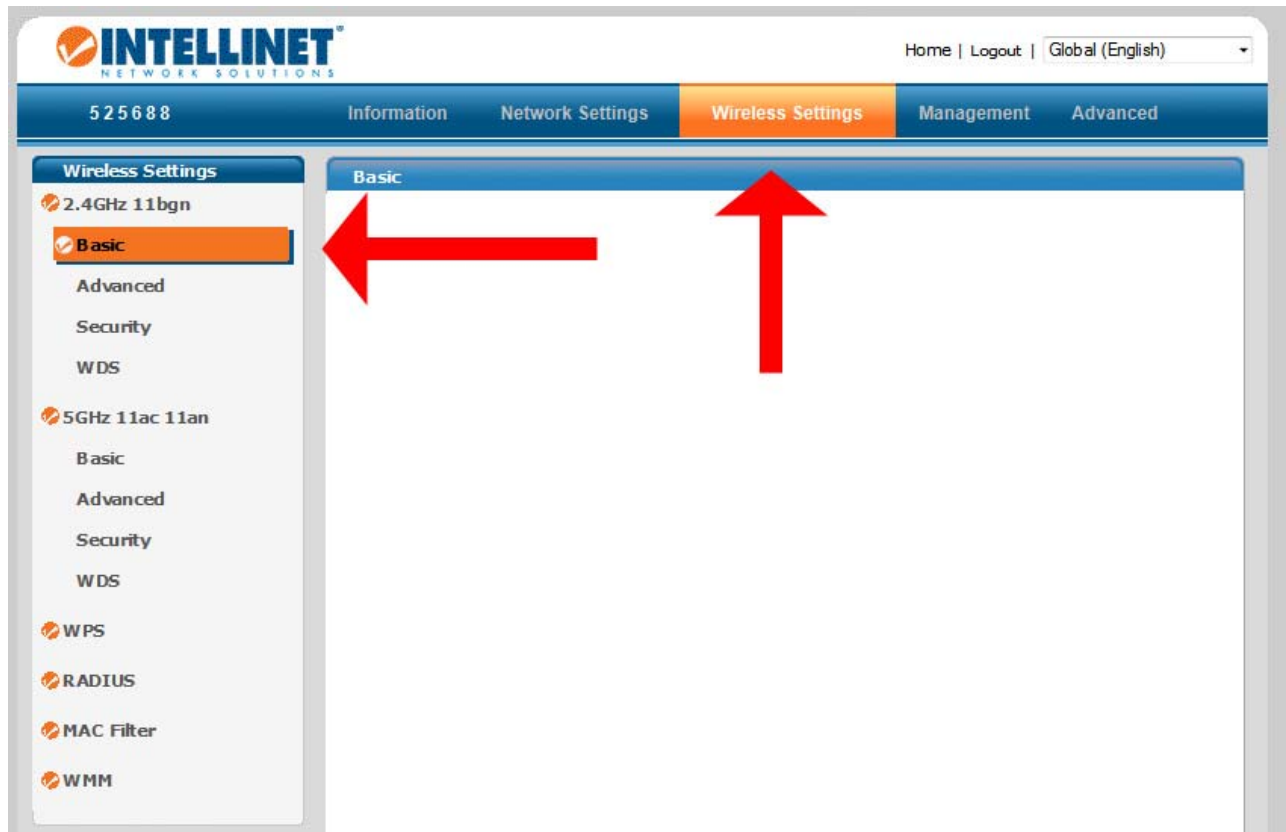

*If you cannot remember your password, reset the access point back to its factory default settings. Refer to I-5. Reset.*

4. You will arrive at the System Information screen shown below.

System	
Model	525688
Product Name	AP801F0275EEF0
Uptime	3 days 00:30:45
Boot from	Internal memory
Version	1.0.4
MAC Address	80:1F:02:75:EE:F0
Management VLAN ID	1
IP Address	10.10.11.221
Default Gateway	10.10.8.1
DNS	10.10.8.10 10.10.8.2
DHCP Server	--

5. Use the menu across the top and down the left side to navigate.

6. Click “Apply” to save changes and reload the access point, or “Cancel” to cancel changes.

***Wait a few seconds for the access point to reload after you “Apply” changes, as shown below.***

Configuration is complete. Reloading now... Please wait for  seconds.

7. Refer to the following chapters for full descriptions of the browser-based configuration interface features.

## IV-1. Information

***Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.***

### IV-1-1. System Information

The System Information page displays basic system information about the access point.

System	
Model	525688
Product Name	AP801F0275EEF0
Uptime	3 days 00:51:42
Boot from	Internal memory
Version	1.0.4
MAC Address	80:1F:02:75:EE:F0
Management VLAN ID	1
IP Address	10.10.11.221
Default Gateway	10.10.8.1
DNS	10.10.8.10 10.10.8.2
DHCP Server	—

### Wired LAN Port Settings

Wired LAN Port	Status	VLAN Mode/ID
Wired Port (#1)	Connected (1000 Mbps Full-Duplex)	Untagged Port / 1

### Wireless 2.4GHz

ICU-WLS2	WPA2-EAP	AES	1	No additional authentication	Disabled

### Wireless 2.4GHz /WDS Disabled

MAC Address	Encryption Type	VLAN Mode/ID
No WDS entries.		

### Wireless 5GHz

Status	Enabled
MAC Address	80:1F:02:75:EE:F1
Channel	Ch 36 + 40 + 44 + 48
Transmit Power	100%

### Wireless 5GHz /SSID

SSID	Authentication Method	Encryption Type	VLAN ID	Additional Authentication	Wireless Client Isolation
ICU-WLS2_5G	WPA/WPA2-EAP	TKIP/AES Mixed Mode	1	No additional authentication	Disabled

### Wireless 5GHz /WDS Disabled

MAC Address	Encryption Type	VLAN Mode/ID
No WDS entries.		

System	
<b>Model</b>	Displays the model number of the access point.
<b>Product Name</b>	Displays the product name for reference, which consists of “AP” plus the MAC address.
<b>Uptime</b>	Displays the total time since the device was turned on.
<b>Boot From</b>	Displays information for the booted hardware.
<b>Version</b>	Displays the firmware version.
<b>MAC Address</b>	Displays the access point’s MAC address.
<b>Management VLAN ID</b>	Displays the management VLAN ID.
<b>IP Address</b>	Displays the IP address of this device. Click “Refresh” to update this value.
<b>Default Gateway</b>	Displays the IP address of the default gateway.
<b>DNS</b>	IP address of DNS (Domain Name Server).
<b>DHCP Server</b>	IP address of DHCP Server.

Wired LAN Port Settings	
<b>Wired LAN Port</b>	Specifies which LAN port.
<b>Status</b>	Displays the status of the LAN port (connected or disconnected).
<b>VLAN Mode/ID</b>	Displays the VLAN mode (tagged or untagged) and VLAN ID for the LAN port. See <b>IV-2-3. VLAN</b>

Wireless 2.4GHz (5GHz)	
<b>Status</b>	Displays the status of the 2.4GHz or 5GHz wireless (enabled or disabled).
<b>MAC Address</b>	Displays the access point’s MAC address.
<b>Channel</b>	Displays the channel number the specified wireless frequency is using for broadcast.
<b>Transmit Power</b>	Displays the wireless radio transmit power level as a percentage.

Wireless 2.4GHz (5GHz) / SSID	
<b>SSID</b>	Displays the SSID name(s) for the specified frequency.
<b>Authentication Method</b>	Displays the authentication method for the specified SSID. See <b>IV-3. Wireless Settings</b> .
<b>Encryption Type</b>	Displays the encryption type for the specified SSID. See <b>IV-3. Wireless Settings</b> .
<b>VLAN ID</b>	Displays the VLAN ID for the specified SSID. See <b>IV-2-3. VLAN</b> .
<b>Additional Authentication</b>	Displays the additional authentication type for the specified SSID. See <b>IV-3. Wireless Settings</b> .
<b>Wireless Client Isolation</b>	Displays whether wireless client isolation is in use for the specified SSID. See <b>IV-2-3. VLAN</b> .

Wireless 2.4GHz (5GHz) / WDS Status	
<b>MAC Address</b>	Displays the peer access point's MAC address.
<b>Encryption Type</b>	Displays the encryption type for the specified WDS. See <b>IV-3-1-4. WDS</b> .
<b>VLAN Mode/ID</b>	Displays the VLAN ID for the specified WDS. See <b>IV-3-1-4. WDS</b> .

<b>Refresh</b>	Click to refresh all information.
----------------	-----------------------------------

## IV-1-2. Wireless Clients

The Wireless Clients page displays information about all wireless clients connected to the access point on the 2.4GHz or 5GHz frequency.

## IV-2. Network Settings

 **Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.**

### IV-2-1. LAN-Side IP Address

The LAN-side IP Address page allows you to configure your access point on your Local Area Network (LAN). You can enable the access point to dynamically receive an IP address from your router's DHCP server or you can specify a static IP address for your access point, as well as configure DNS servers.

 **The access point's default IP address is 192.168.2.1.**

LAN-side IP Address	
IP Address Assignment	DHCP Client
IP Address	10.10.11.221
Subnet Mask	255.255.252.0
Default Gateway	From DHCP 10.10.8.1

LAN-side DNS Servers	
Primary Address	From DHCP 10.10.8.10
Secondary Address	User-Defined 10.10.8.2

LAN-side IP Address	
IP Address Assignment	Select "DHCP Client" for your access point to be assigned a dynamic IP address from your router's DHCP server, or select "Static IP" to manually specify a static/fixed IP address for your access point (below).
IP Address	Specify the IP address here. This IP address will be assigned to your access point and will replace the default IP address.

<b>Subnet Mask</b>	Specify a subnet mask. The default value is 255.255.255.0
<b>Default Gateway</b>	For DHCP users, select “From DHCP” to get a default gateway from your DHCP server or “User-Defined” to enter a gateway manually. For static IP users, the default value is blank.

DHCP users can select to get a DNS servers’ IP address from DHCP or manually enter a value. For static IP users, the default value is blank.

<b>Primary Address</b>	DHCP users can select “From DHCP” to get a primary DNS server’s IP address from DHCP or “User-Defined” to manually enter a value. For static IP users, the default value is blank.
<b>Secondary Address</b>	Users can manually enter a value when the DNS server’s primary address is set to “User-Defined.”

#### IV-2-2. LAN Port

The LAN Port page allows you to configure the settings for your access point's two wired LAN (Ethernet) ports.

Wired LAN Port Settings		
Wired LAN Port	Speed & Duplex	802.3az
Wired Port (#1)	Auto	Enabled

<b>Wired LAN Port</b>	Identifies LAN port 1.
<b>Enable</b>	Enable/disable LAN port.
<b>Speed &amp; Duplex</b>	Select a speed & duplex type for LAN port, or use the “Auto” value. LAN ports can operate up to 1000Mbps and full-duplex enables simultaneous data packets transfer/receive.
<b>Flow Control</b>	Enable/disable flow control. Flow control can pause new session request until current data processing is complete, in order to avoid device overloads under heavy traffic.
<b>802.3az</b>	Enable/disable 802.3az. 802.3az is an Energy Efficient Ethernet feature which disables unused interfaces to reduce power usage.

### IV-2-3. VLAN

The VLAN (Virtual Local Area Network) screen enables you to configure VLAN settings. A VLAN is a local area network which maps workstations virtually instead of physically and allows you to group together or isolate users from each other. VLAN IDs 1 – 4094 are supported.

***VLAN IDs in the range 1 – 4094 are supported.***

VLAN Interface		
<b>Wired LAN Port</b>	<b>VLAN Mode</b>	<b>VLAN ID</b>
Wired Port (#1)	Untagged Port ▾	1
<b>Wireless 2.4GHz</b>	<b>VLAN Mode</b>	<b>VLAN ID</b>
SSID [ICU-WLS2]	Untagged Port	1
<b>Wireless 5GHz</b>	<b>VLAN Mode</b>	<b>VLAN ID</b>
SSID [ICU-WLS2_5G]	Untagged Port	1

Management VLAN	
<b>VLAN ID</b>	1

VLAN Interface	
<b>Wired LAN Port/Wireless</b>	Identifies LAN port 1 and wireless SSIDs (2.4GHz or 5GHz).
<b>VLAN Mode</b>	Select “Tagged Port” or “Untagged Port” for a LAN interface.
<b>VLAN ID</b>	Set a VLAN ID for a specified interface, if “Untagged Port” is selected.

Management VLAN	
<b>VLAN ID</b>	Specify the VLAN ID of the management VLAN. Only the hosts belonging to the same VLAN can manage the device.

### IV-3. Wireless Settings

Information	Network Settings	Wireless Settings	Management	Advanced
-------------	------------------	-------------------	------------	----------

***Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.***

#### IV-3-1. 2.4GHz 11bgn

The 2.4GHz 11bgn menu allows you to view and configure information for your access point's 2.4GHz wireless network across four categories: Basic, Advanced, Security and WDS.

The Basic screen displays basic settings for your access point's 2.4GHz Wi-Fi network(s).

2.4 GHz Basic Settings	
Wireless	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Band	11b/g/n
Enable SSID number	1
SSID1	ICU-WLS2 VLAN ID 1
Auto Channel	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Auto Channel Range	Ch 1 - 11
Auto Channel Interval	Two days <input type="checkbox"/> Change channel even if clients are connected
Channel Bandwidth	Auto
B SS BasicRateSet	1,2,5,5,11 Mbps

<b>Wireless</b>	Enable or disable the access point's 2.4GHz wireless radio. When disabled, no 2.4GHz SSIDs will be active.
<b>Band</b>	Select the wireless standard used for the access point. Combinations of 802.11b, 802.11g & 802.11n can be selected.
<b>Enable SSID Number</b>	Select how many SSIDs to enable for the 2.4GHz frequency from the drop-down menu. A maximum of 16 can be enabled.
<b>SSID#</b>	Enter the SSID name for the specified SSID (up to 16). The SSID can consist of any combination of up to 32 alphanumeric characters.
<b>VLAN ID</b>	Specify a VLAN ID for each SSID.
<b>Auto Channel</b>	Enable/disable auto channel selection. Auto channel selection will automatically set the wireless channel for the access point's 2.4GHz frequency based on availability and potential interference. When disabled, select a channel manually as shown in the next table.
<b>Auto Channel Range</b>	Select a range from which the auto channel setting (above) will choose a channel.
<b>Auto Channel Interval</b>	Specify a frequency for how often the auto channel setting will check/reassign the wireless channel. Check/uncheck the "Change channel even if clients are connected" box according to your preference.
<b>Channel Bandwidth</b>	Set the channel bandwidth: 20MHz (lower performance but less interference), 40MHz (higher performance but potentially higher interference) or Auto (automatically select based on interference level).
<b>BSS BasicRateSet</b>	Set a Basic Service Set (BSS) rate: This is a series of rates to control communication frames for wireless clients.

Auto Channel	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Channel	Ch 11, 2462MHz ▾
Channel Bandwidth	Auto, +Ch 7 ▾
BSS BasicRateSet	1,2,5.5,11 Mbps ▾

When auto channel is disabled, select a wireless channel manually:

<b>Channel</b>	Select a wireless channel from 1 – 11 (1-13).
<b>Channel Bandwidth</b>	Set the channel bandwidth: 20MHz (lower performance but less interference), 40MHz (higher performance but potentially higher interference) or Auto (automatically select based on interference level).
<b>BSS BasicRate Set</b>	Set a Basic Service Set (BSS) rate: This is a series of rates to control communication frames for wireless clients.

These settings are for experienced users only. It's recommended that you not change any of the values on this page unless you are already familiar with these functions.

***Changing these settings can adversely affect the performance of your access point.***

## 2.4 GHz Advanced Settings

Contention Slot	Short ▾
Preamble Type	Short ▾
Guard Interval	Short GI ▾
802.11g Protection	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
802.11n Protection	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
DTIM Period	1 (1-255)
RTS Threshold	2347 (1-2347)
Fragment Threshold	2346 (256-2346)
Multicast Rate	Auto ▾
Tx Power	100% ▾
Beacon Interval	100 (40-1000 ms)
Station idle timeout	60 (30-65535 seconds)

<b>Contention Slot</b>	Select “Short” or “Long.” This value is used for contention windows in WMM (see <b>IV-3-6. WMM</b> ).
<b>Preamble Type</b>	Set the wireless radio preamble type. The preamble type in 802.11 based wireless communication defines the length of the CRC (Cyclic Redundancy Check) block for communication between the access point and roaming wireless adapters. The default value is “Short Preamble.”
<b>Guard Interval</b>	Set the guard interval. A shorter interval can improve performance.
<b>802.11g Protection</b>	Enable/disable 802.11g protection, which increases reliability but reduces bandwidth. (Clients will send a Request to Send [RTS] to the access point, and the access point will broadcast Clear to Send [CTS] before a packet is sent from the client.)
<b>802.11n Protection</b>	Enable/disable 802.11n protection, which increases reliability but reduces bandwidth. (Clients will send a Request to Send [RTS] to the access point, and the access point will broadcast Clear to Send [CTS] before a packet is sent from the client.)

<b>DTIM Period</b>	Set the DTIM (delivery traffic indication message) period value of the wireless radio. The default value is 1.
<b>RTS Threshold</b>	Set the RTS threshold of the wireless radio. The default value is 2347.
<b>Fragment Threshold</b>	Set the fragment threshold of the wireless radio. The default value is 2346.
<b>Multicast Rate</b>	Set the transfer rate for multicast packets or use the “Auto” setting.
<b>Tx Power</b>	Set the power output of the wireless radio. You may not require 100% output power. Setting a lower power output can enhance security since potentially malicious/unknown users in distant areas will not be able to access your signal.
<b>Beacon Interval</b>	Set the beacon interval of the wireless radio. The default value is 100.
<b>Station idle timeout</b>	Set the interval for keepalive messages from the access point to a wireless client to verify if the station is still alive/active.

The access point provides various security options (wireless data encryption). When data is encrypted, information transmitted wirelessly cannot be read by anyone who does not know the correct encryption key.

***It's essential to configure wireless security in order to prevent unauthorized access to your network.***

***Select hard-to-guess passwords which include combinations of numbers, letters and symbols, and change your password regularly.***

## 2.4 GHz Wireless Security Settings

SSID	ICU-WLS2 ▾
Broadcast SSID	Enable ▾
Wireless Client Isolation	Disable ▾
Load Balancing	50 /50

Authentication Method	WPA-EAP ▾
WPA Type	WPA2-EAP ▾
Encryption Type	AES ▾
Key Renewal Interval	60 minute(s)
Additional Authentication	No additional authentication ▾

<b>SSID Selection</b>	Select which SSID to configure security settings for.
<b>Broadcast SSID</b>	Enable or disable SSID broadcast. When enabled, the SSID will be visible to clients as an available Wi-Fi network. When disabled, the SSID will not be visible as an available Wi-Fi network to clients – clients must manually enter the SSID in order to connect. A hidden (disabled) SSID is typically more secure than a visible (enabled) SSID.
<b>Wireless Client Isolation</b>	Enable or disable wireless client isolation. Wireless client isolation prevents clients connected to the access point from communicating with each other and improves security. Typically, this function is useful for corporate environments or public hotspots and can prevent brute force attacks on clients' usernames and passwords.
<b>Load Balancing</b>	Load balancing limits the number of wireless clients connected to an SSID. Set a load balancing value (maximum 50).
<b>Authentication Method</b>	Select an authentication method from the drop-down menu and refer to the information below that is appropriate for your method.
<b>Additional Authentication</b>	Select an additional authentication method from the drop-down menu and refer to the information below ( <b>IV-3-1-3-6.</b> ) that is appropriate for your method.

#### IV-3-1-3-1. No Authentication

Authentication is disabled and no password/key is required to connect to the access point.

***Disabling wireless authentication is not recommended. When disabled, anybody within range can connect to your device's SSID.***

#### IV-3-1-3-2. WEP

WEP (Wired Equivalent Privacy) is a basic encryption type. For a higher level of security, consider using WPA encryption.

<b>Key Length</b>	Select 64-bit or 128-bit. 128-bit is more secure than 64-bit and is recommended.
<b>Key Type</b>	Choose from "ASCII" (any alphanumerical character 0-9, a-z and A-Z) or "Hex" (any characters from 0-9, a-f and A-F).
<b>Default Key</b>	Select which encryption key (1 – 4 below) is the default key. For security purposes, you can set up to four keys (below) and change which is the default key.
<b>Encryption Key 1 – 4</b>	Enter your encryption key/password according to the format you selected above.

#### IV-3-1-3-3. IEEE802.1x/EAP

<b>Key Length</b>	Select 64-bit or 128-bit. 128-bit is more secure than 64-bit and is recommended.
-------------------	--

#### IV-3-1-3-4. WPA-PSK

WPA-PSK is a secure wireless encryption type with strong data protection and user authentication, utilizing 128-bit encryption keys.

<b>WPA Type</b>	Select from WPA/WPA2 Mixed Mode-PSK, WPA2 or WPA only. WPA2 is safer than WPA only, but is not supported by all wireless clients. Make sure your wireless client supports your selection.
<b>Encryption</b>	Select “TKIP/AES Mixed Mode” or “AES” encryption type.
<b>Key Renewal Interval</b>	Specify a frequency for key renewal in minutes.
<b>Pre-Shared Key Type</b>	Choose from “Passphrase” (8 – 63 alphanumeric characters) or “Hex” (up to 64 characters from 0-9, a-f and A-F).
<b>Pre-Shared Key</b>	Please enter a security key/password according to the format you selected above.

#### IV-3-1-3-5. WPA-EAP

<b>WPA Type</b>	Select from WPA/WPA2 Mixed Mode-EAP, WPA2-EAP or WPA-EAP.
<b>Encryption</b>	Select “TKIP/AES Mixed Mode” or “AES” encryption type.
<b>Key Renewal Interval</b>	Specify a frequency for key renewal in minutes.

***WPA-EAP must be disabled to use MAC-RADIUS authentication.***

#### IV-3-1-3-6. Additional Authentication

Additional wireless authentication methods can also be used:

##### MAC Address Filter

Restrict wireless clients' access based on MAC addresses specified in the MAC filter table.

***See IV-3-5.MAC Filter to configure MAC filtering.***

##### MAC Filter & MAC-RADIUS Authentication

Restrict wireless clients' access using both of the above MAC filtering & RADIUS authentication methods.

##### MAC-RADIUS Authentication

Restrict wireless clients' access based on MAC address via a RADIUS server, or password authentication via a RADIUS server.

***See IV-3-4.RADIUS to configure RADIUS servers.***

***WPS must be disabled to use MAC-RADIUS authentication. See IV-3-3. for WPS settings.***

MAC RADIUS Password

☒ Use MAC address

☐ Use the following password

<b>MAC RADIUS Password</b>	Select whether to use MAC address or password authentication via RADIUS server. If you select "Use the following password," enter the password in the field below. The password should match the "Shared Secret" used in <b>IV-3-4. RADIUS.</b>
----------------------------	---

Wireless Distribution System (WDS) can bridge/repeat access points together in an extended network. WDS settings can be configured as shown below.

***When using WDS, configure the IP address of each access point to be in the same subnet and ensure there is only one active DHCP server among connected access points, preferably on the WAN side.***

WDS must be configured on each access point, using correct MAC addresses. All access points should use the same wireless channel and encryption method.

2.4 GHz	
WDS Functionality	Disabled ▾
Local MAC Address	80:1F:02:75:EE:F0

WDS Peer Settings	
WDS #1	MAC Address <input type="text"/>
WDS #2	MAC Address <input type="text"/>
WDS #3	MAC Address <input type="text"/>
WDS #4	MAC Address <input type="text"/>

WDS VLAN	
VLAN Mode	Untagged Port ▾ (Enter at least one MAC address.)
VLAN ID	<input type="text" value="1"/>

WDS Encryption method	
Encryption	None ▾ (Enter at least one MAC address.)

2.4GHz	
<b>WDS Functionality</b>	Select “WDS with AP” to use WDS with an access point or “Dedicated WDS” to use WDS and also block communication with regular wireless clients. When WDS is used, each access point should be configured with corresponding MAC addresses, wireless channel and wireless encryption method.
<b>Local MAC Address</b>	Displays the MAC address of your access point.

WDS Peer Settings	
<b>WDS #</b>	Enter the MAC address for up to four other WDS devices you wish to connect to.

WDS VLAN	
<b>VLAN Mode</b>	Specify the WDS VLAN mode to “Untagged Port” or “Tagged Port.”
<b>VLAN ID</b>	Specify the WDS VLAN ID when “Untagged Port” is selected above.

WDS Encryption method	
<b>Encryption</b>	Select whether to use “None” or “AES” encryption and enter a pre-shared key for AES consisting of 8-63 alphanumeric characters.

#### IV-3-2. 5GHz 11ac 11an

The 5GHz 11ac 11an menu allows you to view and configure information for your access point's 5GHz wireless network across four categories: Basic, Advanced, Security and WDS.

The Basic screen displays basic settings for your access point's 5GHz Wi-Fi network (s).

5 GHz Basic Settings	
Wireless	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Band	11a/n/ac ▾
Enable SSID number	1 ▾
SSID1	ICU-WLS2_5G VLAN ID 1
Auto Channel	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Channel	Ch 36, 5.18GHz ▾
Channel Bandwidth	Auto 80/40/20 MHz ▾
B SS BasicRateSet	6,12,24 Mbps ▾

<b>Wireless</b>	Enable or disable the access point's 5GHz wireless radio. When disabled, no 5GHz SSIDs will be active.
<b>Band</b>	Select the wireless standard used for the access point. Combinations of 802.11a, 802.11n & 802.11ac can be selected.
<b>Enable SSID Number</b>	Select how many SSIDs to enable for the 5GHz frequency from the drop-down menu. A maximum of 16 can be enabled.
<b>SSID#</b>	Enter the SSID name for the specified SSID (up to 16). The SSID can consist of any combination of up to 32 alphanumeric characters.
<b>VLAN ID</b>	Specify a VLAN ID for each SSID.
<b>Auto Channel</b>	Enable/disable auto channel selection. Auto channel selection will automatically set the wireless channel for the access point's 5GHz frequency based on availability and potential

	interference. When disabled, select a channel manually as shown in the next table.
<b>Auto Channel Range</b>	Select a range from which the auto channel setting (above) will choose a channel.
<b>Auto Channel Interval</b>	Specify a frequency for how often the auto channel setting will check/reassign the wireless channel. Check/uncheck the “Change channel even if clients are connected” box according to your preference.
<b>Channel Bandwidth</b>	Set the channel bandwidth: 20MHz (lower performance but less interference), Auto 40/20MHz or Auto 80/40/20MHz (automatically select based on interference level).
<b>BSS BasicRate Set</b>	Set a Basic Service Set (BSS) rate: This is a series of rates to control communication frames for wireless clients.

Auto Channel	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Channel	Ch 36, 5.18GHz ▼
Channel Bandwidth	Auto 80/40/20 MHz ▼
BSS BasicRateSet	6,12,24 Mbps ▼

When auto channel is disabled, select a wireless channel manually:

<b>Channel</b>	Select a wireless channel.
<b>Channel Bandwidth</b>	Set the channel bandwidth: 20MHz (lower performance but less interference), Auto 40/20MHz or Auto 80/40/20MHz (automatically select based on interference level).
<b>BSS BasicRate Set</b>	Set a Basic Service Set (BSS) rate: This is a series of rates to control communication frames for wireless clients.

These settings are for experienced users only. It's recommended that you not change any of the values on this page unless you are already familiar with these functions.

***Changing these settings can adversely affect the performance of your access point.***

### 5 GHz Advanced Settings

Guard Interval	Short GI ▾
802.11n Protection	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
DTIM Period	1 (1-255)
RTS Threshold	2347 (1-2347)
Fragment Threshold	2346 (256-2346)
Multicast Rate	Auto ▾
Tx Power	100% ▾
Beacon Interval	100 (40-1000 ms)
Station idle timeout	60 (30-65535 seconds)

<b>Guard Interval</b>	Set the guard interval. A shorter interval can improve performance.
<b>802.11n Protection</b>	Enable/disable 802.11n protection, which increases reliability but reduces bandwidth. (Clients will send a Request to Send (RTS) to the access point, and the access point will broadcast Clear to Send (CTS) before a packet is sent from the client.)
<b>DTIM Period</b>	Set the DTIM (delivery traffic indication message) period value of the wireless radio. The default value is 1.
<b>RTS Threshold</b>	Set the RTS threshold of the wireless radio. The default value is 2347.
<b>Fragment Threshold</b>	Set the fragment threshold of the wireless radio. The default value is 2346.
<b>Multicast Rate</b>	Set the transfer rate for multicast packets or use the "Auto" setting.
<b>Tx Power</b>	Set the power output of the wireless radio. You may not require 100% output power. Setting a lower power output can enhance security since potentially malicious/unknown users in distant areas will not be able to access your signal.
<b>Beacon Interval</b>	Set the beacon interval of the wireless radio. The default value is 100.
<b>Station idle timeout</b>	Set the interval for keepalive messages from the access point to a wireless client to verify if the station is still alive/active.

The access point provides various security options (wireless data encryption). When data is encrypted, information transmitted wirelessly cannot be read by anyone who does not know the correct encryption key.

***It's essential to configure wireless security in order to prevent unauthorized access to your network.***

***Select hard-to-guess passwords which include combinations of numbers, letters and symbols, and change your password regularly.***

5 GHz Wireless Security Settings	
SSID	ICU-WLS2_5G ▾
Broadcast SSID	Enable ▾
Wireless Client Isolation	Disable ▾
Load Balancing	50 /50
Authentication Method	WPA-EAP ▾
WPA Type	WPA/WPA2 mixed mode-EAP ▾
Encryption Type	TKIP/AES Mixed Mode ▾
Key Renewal Interval	60 minute(s)
Additional Authentication	No additional authentication ▾

<b>SSID Selection</b>	Select which SSID to configure security settings for.
<b>Broadcast SSID</b>	Enable or disable SSID broadcast. When enabled, the SSID will be visible to clients as an available Wi-Fi network. When disabled, the SSID will not be visible as an available Wi-Fi network to clients – clients must manually enter the SSID in order to connect. A hidden (disabled) SSID is typically more secure than a visible (enabled) SSID.

<b>Wireless Client Isolation</b>	Enable or disable wireless client isolation. Wireless client isolation prevents clients connected to the access point from communicating with each other and improves security. Typically, this function is useful for corporate environments or public hot spots and can prevent brute force attacks on clients' usernames and passwords.
<b>Load Balancing</b>	Load balancing limits the number of wireless clients connected to an SSID. Set a load balancing value (maximum 50).
<b>Authentication Method</b>	Select an authentication method from the drop-down menu and refer to the information below that is appropriate for your method.
<b>Additional Authentication</b>	Select an additional authentication method from the drop-down menu and refer to the information below that is appropriate for your method.

Refer back to **IV-3-1-3. Security** for more information on authentication and additional authentication types.

Wireless Distribution System (WDS) can bridge/repeat access points together in an extended network. WDS settings can be configured as shown below.

***When using WDS, configure the IP address of each access point to be in the same subnet and ensure there is only one active DHCP server among connected access points, preferably on the WAN side.***

WDS must be configured on each access point, using correct MAC addresses. All access points should use the same wireless channel and encryption method.

5 GHz WDS Mode	
WDS Functionality	Disabled ▾
Local MAC Address	80:1F:02:75:EE:F1

WDS Peer Settings	
WDS #1	MAC Address <input type="text"/>
WDS #2	MAC Address <input type="text"/>
WDS #3	MAC Address <input type="text"/>
WDS #4	MAC Address <input type="text"/>

WDS VLAN	
VLAN Mode	Untagged Port ▾ (Enter at least one MAC address.)
VLAN ID	1 <input type="text"/>

Encryption method	
Encryption	None ▾ (Enter at least one MAC address.)

5GHz WDS Mode	
<b>WDS Functionality</b>	Select “WDS with AP” to use WDS with access point or “Dedicated WDS” to use WDS and also block communication with regular wireless clients. When WDS is used, each access point should be configured with corresponding MAC addresses, wireless channel and wireless encryption method.
<b>Local MAC Address</b>	Displays the MAC address of your access point.

WDS Peer Settings	
<b>WDS #</b>	Enter the MAC address for up to four other WDA devices you wish to connect.

WDS VLAN	
<b>VLAN Mode</b>	Specify the WDS VLAN mode to “Untagged Port” or “Tagged Port.”
<b>VLAN ID</b>	Specify the WDS VLAN ID when “Untagged Port” is selected above.

WDS Encryption	
<b>Encryption</b>	Select whether to use “None” or “AES” encryption and enter a pre-shared key for AES with 8-63 alphanumeric characters.

### IV-3-3. WPS

Wi-Fi Protected Setup is a simple way to establish connections between WPS-compatible devices. WPS can be activated on compatible devices by pushing a WPS button on the device or from within the device's firmware/configuration interface (known as PBC or "Push Button Configuration"). When WPS is activated in the correct manner and at the correct time for two compatible devices, they will automatically connect. "PIN code WPS" is a variation of PBC which includes the additional use of a PIN code between the two devices for verification.

***Refer to the manufacturer's instructions for your other WPS device.***

WPS	<input checked="" type="checkbox"/> Enable
-----	--

WPS	
Product PIN	01977608 <input type="button" value="Generate PIN"/>
Push-button WPS	<input type="button" value="Start"/>
WPS by PIN	<input type="text"/> <input type="button" value="Start"/>

WPS Security	
WPS Status	Configured <input type="button" value="Release"/>

<b>WPS</b>	Check/uncheck this box to enable/disable WPS functionality. WPS must be disabled when using MAC RADIUS authentication (see <b>IV-3-1-3-6 &amp; IV-3-4</b> ).
------------	--

<b>Product PIN</b>	Displays the WPS PIN code of the device, used for PIN code WPS. You will be required to enter this PIN code into another WPS device for PIN code WPS. Click “Generate PIN” to generate a new WPS PIN code.
<b>Push-Button WPS</b>	Click “Start” to activate WPS on the access point for approximately 2 minutes. This has the same effect as physically pushing the access point’s WPS button.
<b>WPS by PIN</b>	Enter the PIN code of another WPS device and click “Start” to attempt to establish a WPS connection for approximately 2 minutes.

<b>WPS Status</b>	WPS security status is displayed here. Click “Release” to clear the existing status.
-------------------	--

#### IV-3-4. RADIUS

The RADIUS submenu allows you to configure the access point's RADIUS server settings, categorized into three submenus: RADIUS settings, Internal Server and RADIUS accounts.

A RADIUS server provides user-based authentication to improve security and offer wireless client control – users can be authenticated before gaining access to a network.

The access point can utilize both a primary and secondary (backup) RADIUS server for each of its wireless frequencies (2.4GHz & 5GHz). External RADIUS servers can be used or the access point's internal RADIUS server can be used.

**To use RADIUS servers, go to “Wireless Settings” → “Security” and select “MAC RADIUS Authentication” → “Additional Authentication” and select “MAC RADIUS Authentication” (see IV-3-1-3. & IV-3-2-3).**

Configure the RADIUS server settings for 2.4GHz & 5GHz. Each frequency can use an internal or external RADIUS server.

RADIUS Server (2.4 GHz)	
Primary RADIUS Server	
RADIUS Server	10.10.8.10
Authentication Port	1812
Shared Secret	●●●●●●●●
Session Timeout	3600 second(s)
Accounting	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Accounting Port	1813
Secondary RADIUS Server	
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Accounting Port	1813

RADIUS Server (5 GHz)	
<b>Primary RADIUS Server</b>	
RADIUS Server	10.10.8.10
Authentication Port	1812
Shared Secret	●●●●●●●●
Session Timeout	3600 second(s)
Accounting	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Accounting Port	1813
<b>Secondary RADIUS Server</b>	
RADIUS Server	
Authentication Port	1812
Shared Secret	
Session Timeout	3600 second(s)
Accounting	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Accounting Port	1813

<b>RADIUS Type</b>	Select “Internal” to use the access point’s built-in RADIUS server or “external” to use an external RADIUS server.
<b>RADIUS Server</b>	Enter the RADIUS server host IP address.
<b>Authentication Port</b>	Set the UDP port used in the authentication protocol of the RADIUS server. Value must be between 1 – 65535.
<b>Shared Secret</b>	Enter a shared secret/password between 1 – 99 characters in length. This should match the “MAC RADIUS” password used in <b>IV-3-1-3-6</b> or <b>IV-3-2-3</b> .
<b>Session Timeout</b>	Set a duration of session timeout in seconds between 0 – 86400.
<b>Accounting</b>	Enable or disable RADIUS accounting.
<b>Accounting Port</b>	When accounting is enabled (above), set the UDP port used in the accounting protocol of the RADIUS server. Value must be between 1 – 65535.

The access point features a built-in RADIUS server which can be configured as shown below used when “Internal” is selected for “RADIUS Type” in the “Wireless Settings” → “RADIUS” → “RADIUS Settings” menu.

**To use RADIUS servers, go to “Wireless Settings” → “Security” and select “MAC RADIUS Authentication” → “Additional Authentication” and select “MAC RADIUS Authentication” (see IV-3-1-3. & IV-3-2-3).**

Internal Server	
Internal Server	<input type="checkbox"/> Enable
EAP Internal Authentication	PEAP(MS-PEAP) ▼
EAP Certificate File Format	PKCS#12(*.pfx/*.p12)
EAP Certificate File	<input type="button" value="Upload"/>
Shared Secret	<input type="text"/>
Session-Timeout	3600 second(s)
Termination-Action	<input checked="" type="radio"/> Reauthentication (RADIUS-Request) <input type="radio"/> Not-Reauthentication (Default) <input type="radio"/> Not-Send

<b>Internal Server</b>	Check/uncheck to enable/disable the access point’s internal RADIUS server.
<b>EAP Internal Authentication</b>	Select EAP internal authentication type from the drop down menu.
<b>EAP Certificate File Format</b>	Displays the EAP certificate file format: PCK#12(*.pfx/*.p12)
<b>EAP Certificate File</b>	Click “Upload” to open a new window and select the location of an EAP certificate file to use. If no certificate file is uploaded, the internal RADIUS server will use a self-made certificate.
<b>Shared Secret</b>	Enter a shared secret/password for use between the internal RADIUS server and RADIUS client. The shared secret should be 1 – 99 characters in length. This should match the “MAC RADIUS” password used in <b>IV-3-1-3-6</b> or <b>IV-3-2-3</b> .

<b>Session Timeout</b>	Set a duration of session timeout in seconds between 0 – 86400.
<b>Termination Action</b>	Select a termination-action attribute: “Reauthentication” sends a RADIUS request to the access point, “Not-Reathentication” sends a default termination-action attribute to the access point, “Not-Send” no termination-action attribute is sent to the access point.

The internal RADIUS server can authenticate up to 256 user accounts. The RADIUS Accounts page allows you to configure and manage users.

<b>Password</b>	Enter or edit a password for the specified user.

#### IV-3-5. MAC Filter

MAC (media access control) filtering is a security feature that can help to prevent unauthorized users from connecting to your access point.

This function allows you to define a list of network devices permitted to connect to the access point. Devices are each identified by their unique MAC address. If a device which is not on the list of permitted MAC addresses attempts to connect to the access point, it will be denied.

**To enable MAC filtering, go to “Wireless Settings” → “2.4GHz 11bgn/5GHz 11ac 11an” → “Security” → “Additional Authentication” and select “MAC Filter” (see IV-3-1-3. & IV-3-2-3).**

The MAC address filtering table is displayed below:

Add MAC Addresses

AddReset

MAC Address Filtering Table

Select	MAC Address
No MAC Address entries.	

Delete SelectedDelete AllExport

<b>Add MAC Address</b>	Enter a MAC address of computer or network device manually; e.g., “aa-bb-cc-dd-ee-ff”; or enter multiple MAC addresses separated with commas; e.g., “aa-bb-cc-dd-ee-ff,aa-bb-cc-dd-ee-gg.”
<b>Add</b>	Click “Add” to add the MAC address to the MAC address filtering table.
<b>Reset</b>	Clear all fields.

MAC address entries will be listed in the MAC Address Filtering Table. Select an entry using the “Select” checkbox.

<b>Select</b>	Delete selected or all entries from the table.
<b>MAC Address</b>	The MAC address is listed here.
<b>Delete Selected</b>	Delete the selected MAC address from the list.
<b>Delete All</b>	Delete all entries from the MAC address filtering table.
<b>Export</b>	Click “Export” to save a copy of the MAC filtering table. A new window will pop up for you to select a location to save the file.

#### IV-3-6. WMM

Wi-Fi Multimedia (WMM) is a Wi-Fi Alliance interoperability certification based on the IEEE 802.11e standard, which provides Quality of Service (QoS) features to IEEE 802.11 networks. WMM prioritizes traffic according to four categories: background, best effort, video and voice.

WMM-EDCA Settings				
WMM Parameters of Access Point				
	CWMin	CWMax	AIFSN	TxOP
Back Ground	4	10	7	0
Best Effort	4	6	3	0
Video	3	4	1	94
Voice	2	3	1	47

WMM Parameters of Station				
	CWMin	CWMax	AIFSN	TxOP
Back Ground	4	10	7	0
Best Effort	4	10	3	0
Video	3	4	2	94
Voice	2	3	2	47

Configuring WMM consists of adjusting parameters on queues for different categories of wireless traffic. Traffic is sent to the following queues:

<b>Background</b>	Low Priority	High throughput, non-time-sensitive bulk data; e.g., FTP
<b>Best Effort</b>	Medium Priority	Traditional IP data, medium throughput and delay.
<b>Video</b>	High Priority	Time-sensitive video data with minimum time delay.
<b>Voice</b>	High Priority	Time-sensitive data such as VoIP and streaming media with minimum time delay.

Queues automatically provide minimum transmission delays for video, voice, multimedia and critical applications. The values can further be adjusted manually:

<b>CWMin</b>	Minimum Contention Window (milliseconds): This value is input to the initial random backoff wait time algorithm for retry of a data frame transmission. The backoff wait time will be generated between 0 and this value. If the frame is not sent, the random backoff value is doubled until the value reaches the number defined by CWMax (below). The CWMin value must be lower than the CWMax value. The contention window scheme helps to avoid frame collisions and determine priority of frame transmission. A shorter window has a higher probability (priority) of transmission.
<b>CWMax</b>	Maximum Contention Window (milliseconds): This value is the upper limit to random backoff value doubling (see above).
<b>AIFSN</b>	Arbitration Inter-Frame Space (milliseconds): Specifies additional time between when a channel goes idle and the AP/client sends data frames. Traffic with a lower AIFSN value has a higher priority.
<b>TxOP</b>	Transmission Opportunity (milliseconds): The maximum interval of time an AP/client can transmit. This makes channel access more efficiently prioritized. A value of 0 means only one frame per transmission. A greater value effects higher priority.

## IV-4. Management

**Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.**

### IV-4-1. Admin

You can change the password used to log in to the browser-based configuration interface here. It is advised you do so for security purposes.

**If you change the administrator password, make a note of the new password. In the event that you forget this password and are unable to log in to the browser-based configuration interface, see I-5. Reset for how to reset the access point.**

Account to Manage This Device	
Administrator Name	<input type="text" value="admin"/>
Administrator Password	<input type="password" value="•••••"/> (4-32 Characters)
	<input type="password" value="•••••"/> (Confirm)
<input type="button" value="Apply"/>	

Advanced Settings

SNMP Trap	<input type="text" value="Disabled"/>
SNMP Trap Community	<input type="text" value="public"/>
SNMP Trap Manager	<input type="text"/>
<input type="button" value="Apply"/>	

Account to Manage This Device	
<b>Administrator Name</b>	Set the access point's administrator name. This is used to log in to the browser-based configuration interface and must be between 4-16 alphanumeric characters (case sensitive).
<b>Administrator Password</b>	Set the access point's administrator password. This is used to log in to the browser-based configuration interface and must be between 4-32 alphanumeric characters (case sensitive).

Advanced Settings	
<b>Product Name</b>	Edit the product name according to your preference consisting of 1-32 alphanumeric characters. This name is used for reference purposes.
<b>Management Protocol</b>	Check/uncheck the boxes to enable/disable specified management interfaces (see below). When SNMP is enabled, complete the SNMP fields below.
<b>SNMP Version</b>	Select SNMP version appropriate for your SNMP manager.
<b>SNMP Get Community</b>	Enter an SNMP Get Community name for verification with the SNMP manager for SNMP-GET requests.
<b>SNMP Set Community</b>	Enter an SNMP Set Community name for verification with the SNMP manager for SNMP-SET requests.
<b>SNMP Trap</b>	Enable or disable SNMP Trap to notify SNMP manager of network errors.
<b>SNMP Trap Community</b>	Enter an SNMP Trap Community name for verification with the SNMP manager for SNMP-TRAP requests.
<b>SNMP Trap Manager</b>	Specify the IP address or server name (2-128 alphanumeric characters) of the SNMP manager.

**HTTP**

*Internet browser HTTP protocol management interface*

**HTTPS**

*Internet browser HTTPS protocol management interface*

**TELNET**

*Client terminal with Telnet protocol management interface*

**SSH**

*Client terminal with SSH protocol version 1 or 2 management interface*

**SNMP**

*Simple Network Management Protocol. SNMPv1, v2 & v3 protocol supported. SNMPv2 can be used with community based-authentication. SNMPv3 uses user-based security model (USM) architecture.*

## IV-4-2. Date and Time

You can configure the time zone settings of your access point here. The date and time of the device can be configured manually or can be synchronized with a time server.

Date and Time Settings

Local Time

Update Interval

1

(Hours)

Time Zone

(GMT-05:00) Eastern Time (US & Canada)

Date and Time Settings	
<b>Local Time</b>	Set the access point's date and time manually using the drop-down menus.
<b>Acquire Current Time from your PC</b>	Click "Acquire Current Time from Your PC" to enter the required values automatically according to your computer's current time and date.

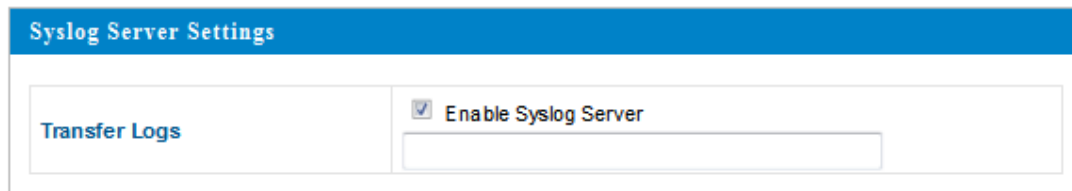

NTP Time Server	
<b>Use NTP</b>	The access point also supports NTP (Network Time Protocol) for automatic time and date setup.
<b>Server Name</b>	Enter the hostname or IP address of the time server if you wish.

<b>Update Interval</b>	Specify a frequency (in hours) for the access point to update/synchronize with the NTP server.
------------------------	--

<b>Time Zone</b>	
<b>Time Zone</b>	Select the time zone of your country/region. If your country/region is not listed, select another country/region whose time zone is the same as yours.

### IV-4-3. Syslog Server

The system log can be sent to a server.

The image shows a web interface titled "Syslog Server Settings". On the left, there is a link labeled "Transfer Logs". On the right, there is a checkbox labeled "Enable Syslog Server" which is checked. Below the checkbox is a text input field for entering a hostname, domain, or IP address.

<b>Transfer Logs</b>	Check/uncheck the box to enable/disable the use of a syslog server, and enter a hostname, domain or IP address for the server consisting of up to 128 alphanumeric characters.
----------------------	--

The remote log function uses the Syslog Protocol, which is a standard for forwarding log messages in an IP network. Syslog is a client/server protocol. The Syslog sender (the Network Camera) sends a small (less than 1KB) textual message to the Syslog server. This user manual shows one example of a Syslog server, the 3CDaemon utility by 3Com Corp.

#### IV-4-4. I' m here!

The Intellinet AC1200 Access Point features a built-in buzzer which can sound on command using the “I’m Here” page. This is useful for network administrators and engineers working in complex network environments to locate the access point.

Duration of Sound	
Duration of Sound	<input type="text" value="10"/> (1-300 seconds)

Sound Buzzer

The buzzer is loud!

<b>Duration of Sound</b>	Set the duration for which the buzzer will sound when the “Sound Buzzer” button is clicked.
<b>Sound Buzzer</b>	Activate the buzzer sound for the above specified duration of time.

## IV-5. Advanced

***Screenshots displayed are examples. The information shown on your screen will vary depending on your configuration.***

### IV-5-1. LED Settings

The access point's LEDs can be manually enabled or disabled according to your preference.

LED Settings	
Power LED	<input checked="" type="radio"/> On <input type="radio"/> Off
Diag LED	<input checked="" type="radio"/> On <input type="radio"/> Off

<b>Power LED</b>	Select on or off.
<b>Diag LED</b>	Select on or off.

## IV-5-2. Update Firmware

The Firmware page allows you to update the system firmware to a more recent version. Updated firmware versions often offer increased performance and security, as well as bug fixes. You can download the latest firmware from the website.

Firmware Location

Update firmware from

☒ a file on your PC

Update firmware from PC

Firmware Update File

Browse...

No file selected.

Update

***Do not switch off or disconnect the access point during a firmware upgrade, as this could damage the device.***

<b>Update Firmware From</b>	Select “a file on your PC” to upload firmware from your local computer.
<b>Firmware Update File</b>	Click “Browse” to open a new window to locate and select the firmware file in your computer.
<b>Update</b>	Click “Update” to upload the specified firmware file to your access point.

### IV-5-3. Save/Restore Settings

The access point's Save/Restore Settings page enables you to save/back up the access point's current settings as a file to your local computer, and restore the access point to previously saved settings.

Save/Restore Method	
<a href="#">Using Device</a>	<input checked="" type="radio"/> Using your PC

Save Settings to PC	
<a href="#">Save Settings</a>	<input type="checkbox"/> Encrypt the configuration file with a password. <input type="text"/>
<input type="button" value="Save"/>	

Restore Settings from PC	
<a href="#">Restore Settings</a>	<input type="button" value="Browse..."/> No file selected. <input type="checkbox"/> Open file with password. <input type="text"/>
<input type="button" value="Restore"/>	

Save / Restore Settings	
<b>Using Device</b>	Select “Using your PC” to save the access point’s settings to your local computer.

Save Settings to PC	
<b>Save Settings</b>	Click “Save” to save settings. A new window will open to specify a location to save the settings file. You can also check the “Encrypt the configuration file with a password” box and enter a password to protect the file in the field underneath, if you wish.

Restore Settings from PC	
<b>Restore Settings</b>	Click the browse button to find a previously saved settings file on your computer, then click “Restore” to replace your current settings. If your settings file is encrypted with a password, check the “Open file with password” box and enter the password in the field underneath.

#### IV-5-4. Factory Default

If the access point malfunctions or is not responding, then it is recommended that you reboot the device (see **IV-5.5**) or reset the device back to its factory default settings. You can reset the access point back to its default settings using this feature if the location of the access point is not convenient to access the reset button.

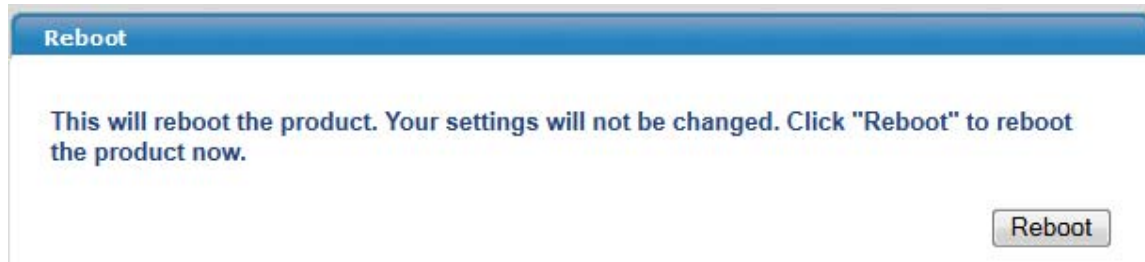

<b>Factory Default</b>	Click “Factory Default” to restore settings to the factory default. A pop-up window will appear and ask you to confirm.
------------------------	---

***After resetting to factory defaults, wait for the access point to reset and restart.***

#### IV-5-5. Reboot

If the access point malfunctions or is not responding, then it is recommended that you reboot the device or reset the access point back to its factory default settings (see **IV-5-4**). You can reboot the access point remotely using this feature.

<b>Reboot</b>	Click "Reboot" to reboot the device. A countdown will indicate the progress of the reboot.
---------------	--

## V. *Appendix*

---

### V-1. **Configuring your IP address**

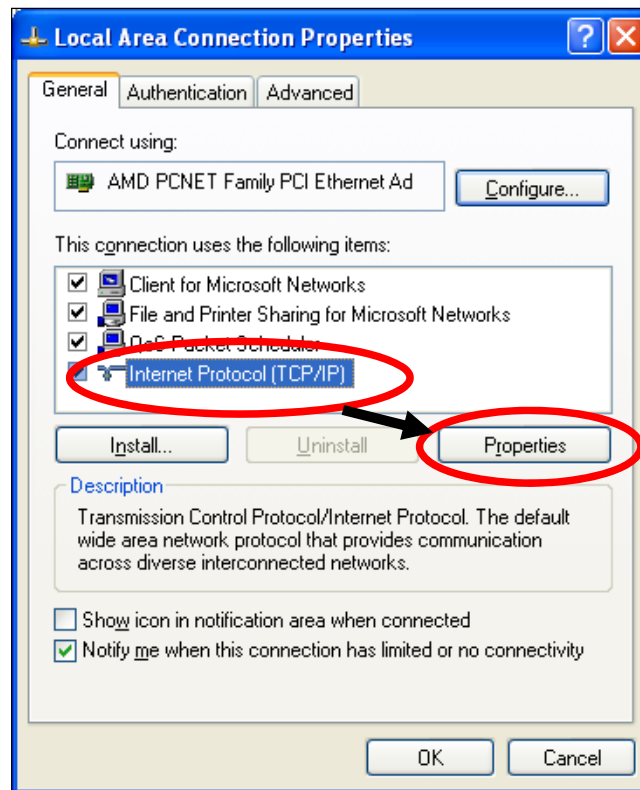

The access point uses the default IP address **192.168.2.1**. In order to access the browser-based configuration interface, you need to modify the IP address of your computer to be in the same IP address subnet; e.g., **192.168.2.x (x = 3 – 254)**.

The procedure for modifying your IP address varies across different operating systems. Follow the guide appropriate for your operating system.

In the following examples, we use the IP address **192.168.2.10** though you can use any IP address in the range **192.168.2.x (x = 3 – 254)**.

## V-1-1. Windows XP

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel.” Double-click the “Network and Internet Connections” icon, click “Network Connections,” then double-click “Local Area Connection.” The Local Area Connection Status window will then appear. Click “Properties.”

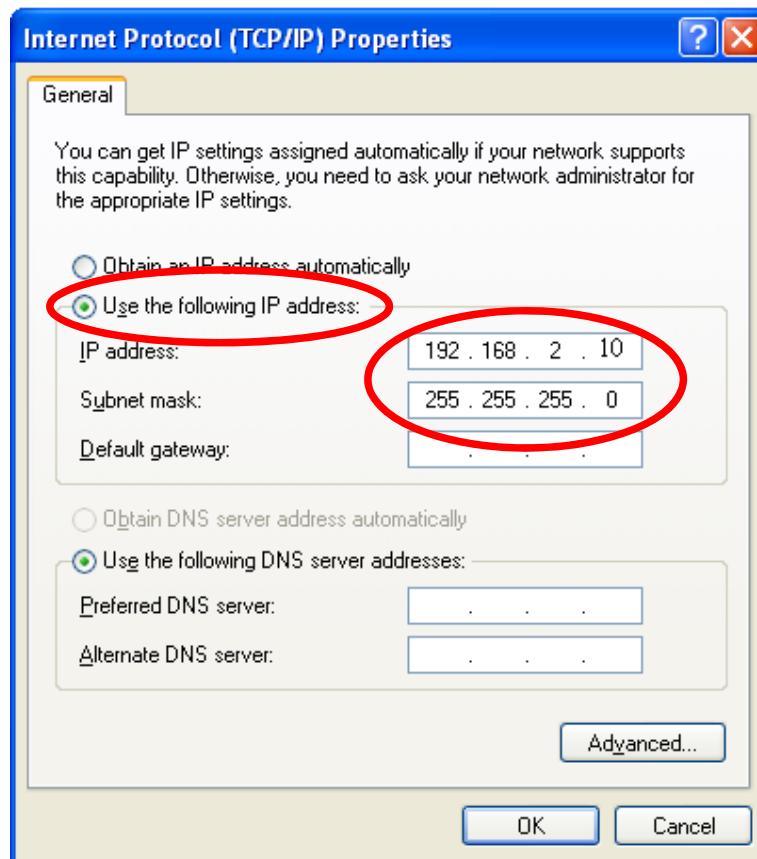

2. Select “Use the following IP address,” then input the following values:

**IP address:** 192.168.2.10

**Subnet mask:** 255.255.255.0

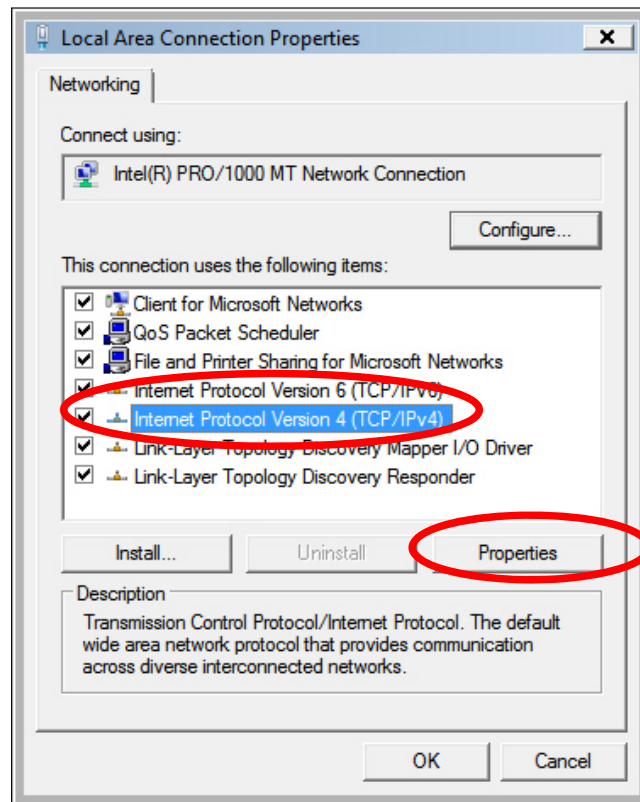

Click “OK” when finished.

## V-1-2. Windows Vista

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel.” Click “View Network Status and Tasks,” then click “Manage Network Connections.” Right-click “Local Area Network,” then select “Properties.” The Local Area Connection Properties window will then appear. Select “Internet Protocol Version 4 (TCP / IPv4),” and then click “Properties.”

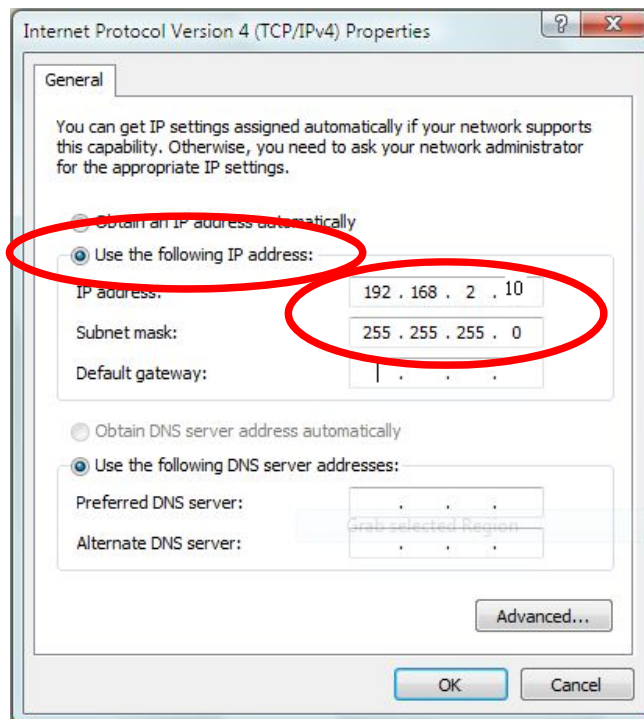

2. Select “Use the following IP address,” then input the following values:

**IP address:** 192.168.2.10

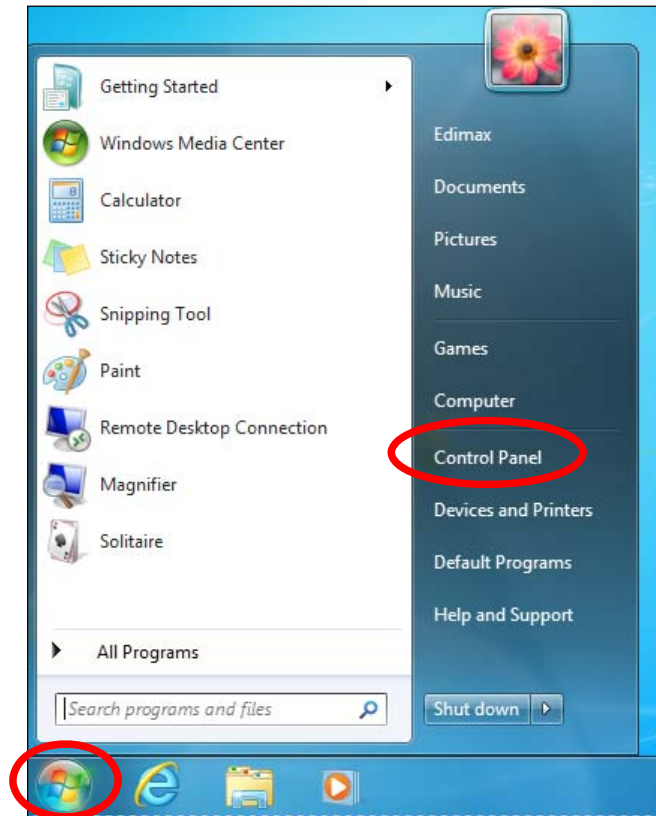

**Subnet mask:** 255.255.255.0

Click “OK” when finished.

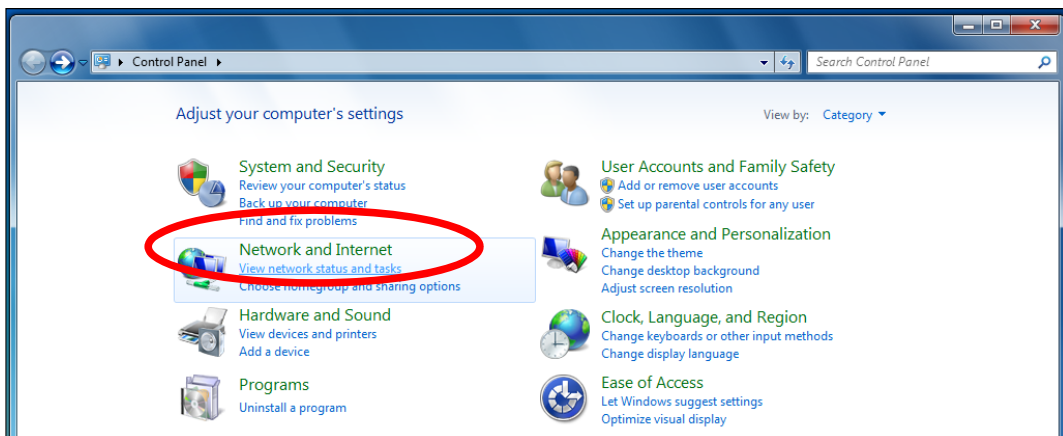

### V-1-3. Windows 7

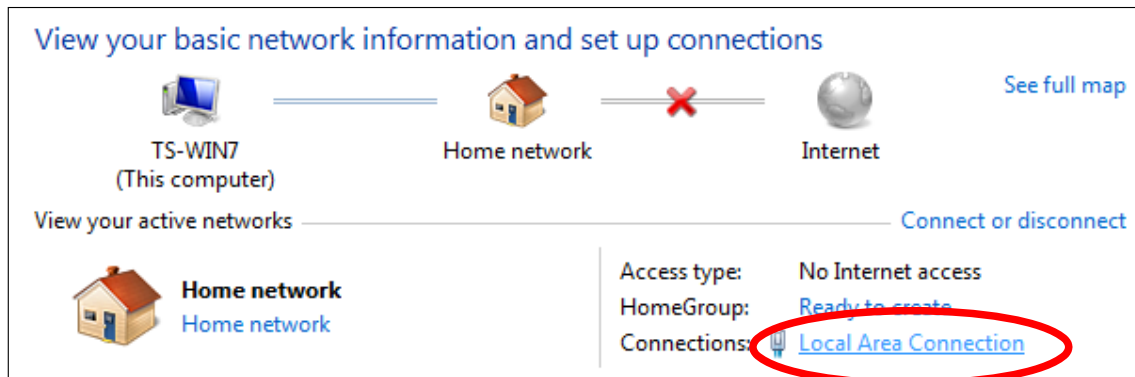

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel.”

2. Under “Network and Internet,” click “View network status and tasks.”

### 3. Click “Local Area Connection.”

### 4. Click “Properties.”

5. Select “Internet Protocol Version 4 (TCP/IPv4),” then click “Properties.”

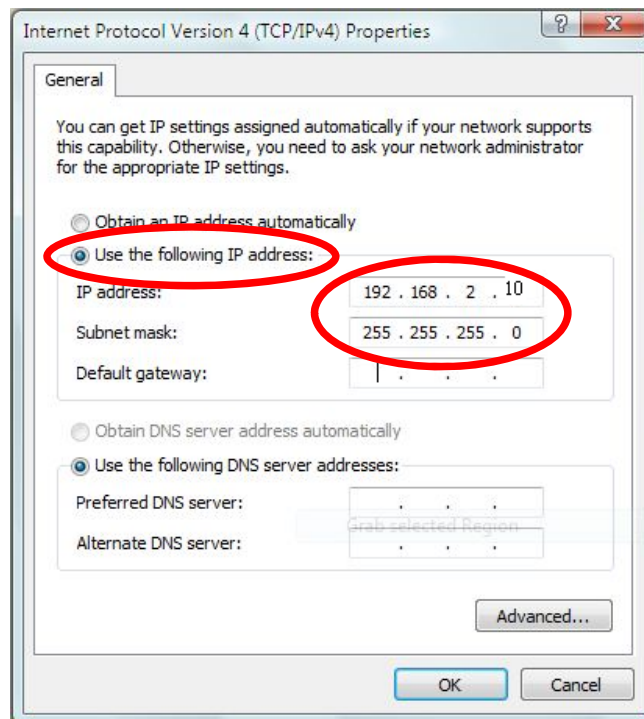

6. Select “Use the following IP address,” then input the following values:

**IP address:** 192.168.2.10

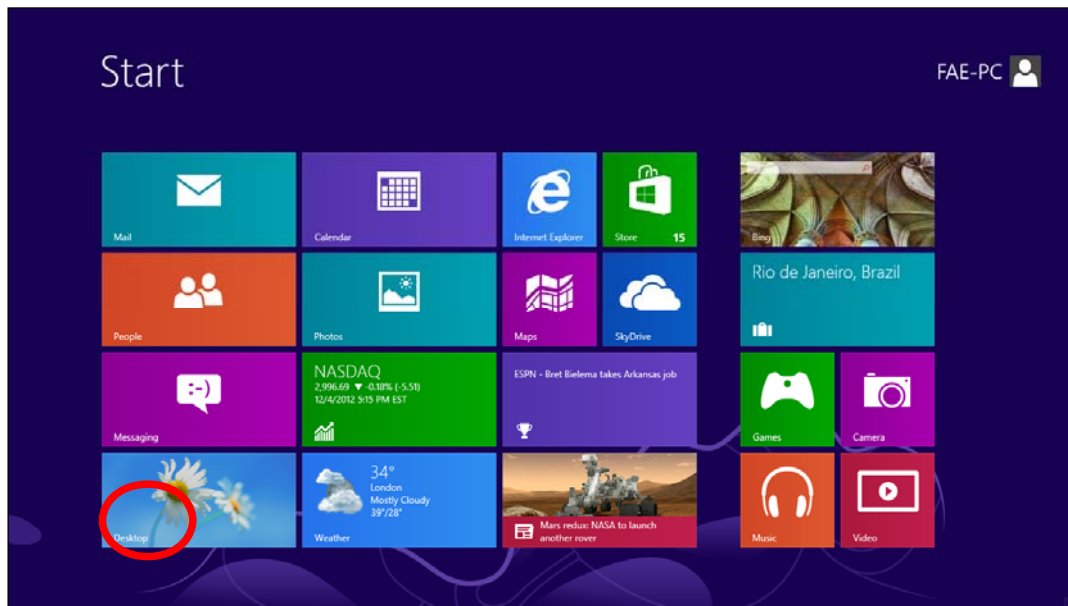

**Subnet mask:** 255.255.255.0

Click “OK” when finished.

## V-1-4. Windows 8

1. From the Windows 8 Start screen, you need to switch to desktop mode. Move your cursor to the bottom left of the screen and click.

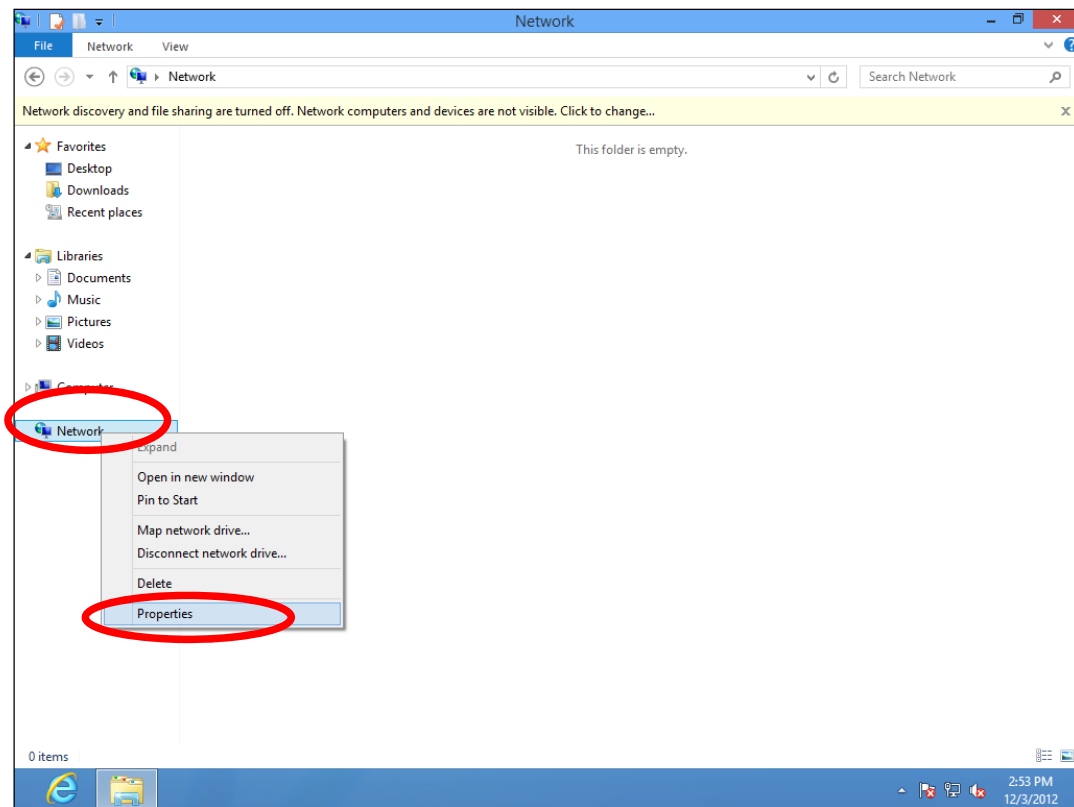

2. In desktop mode, click the File Explorer icon in the bottom left of the screen, as shown below.

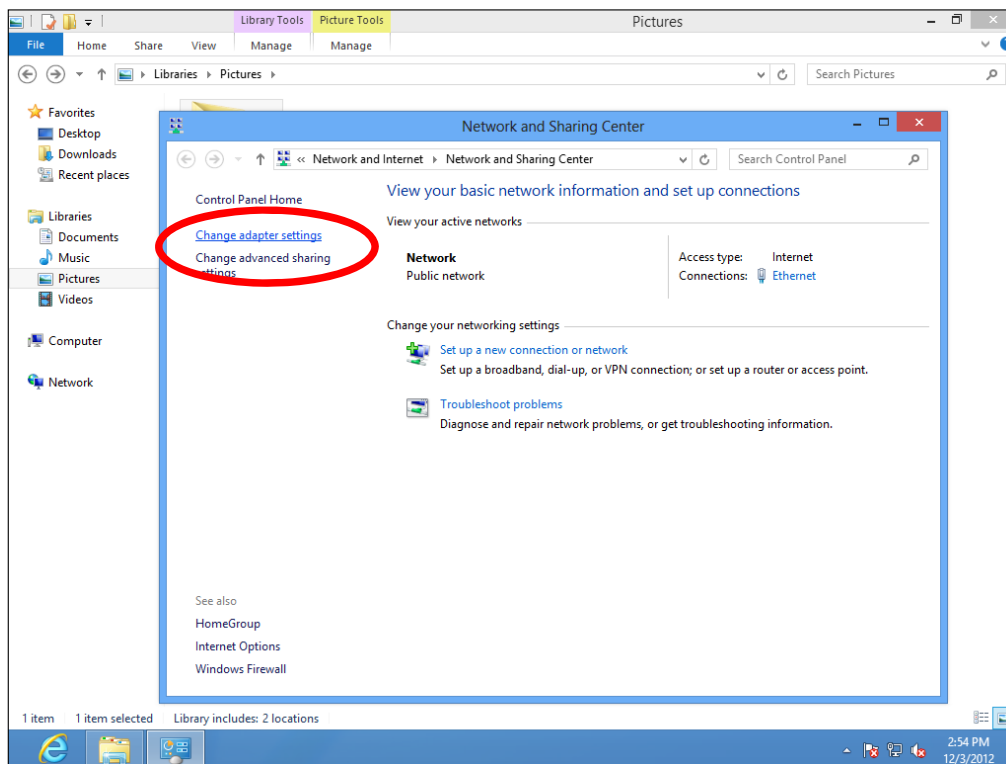

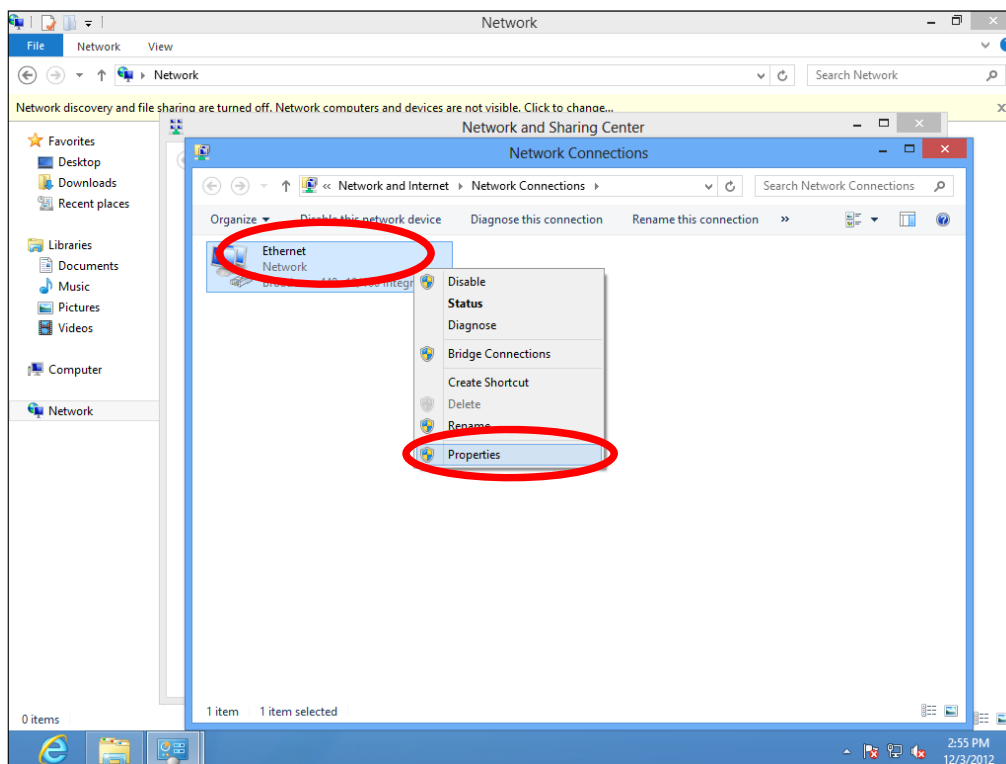

**3.** Right-click “Network,” then select “Properties.”

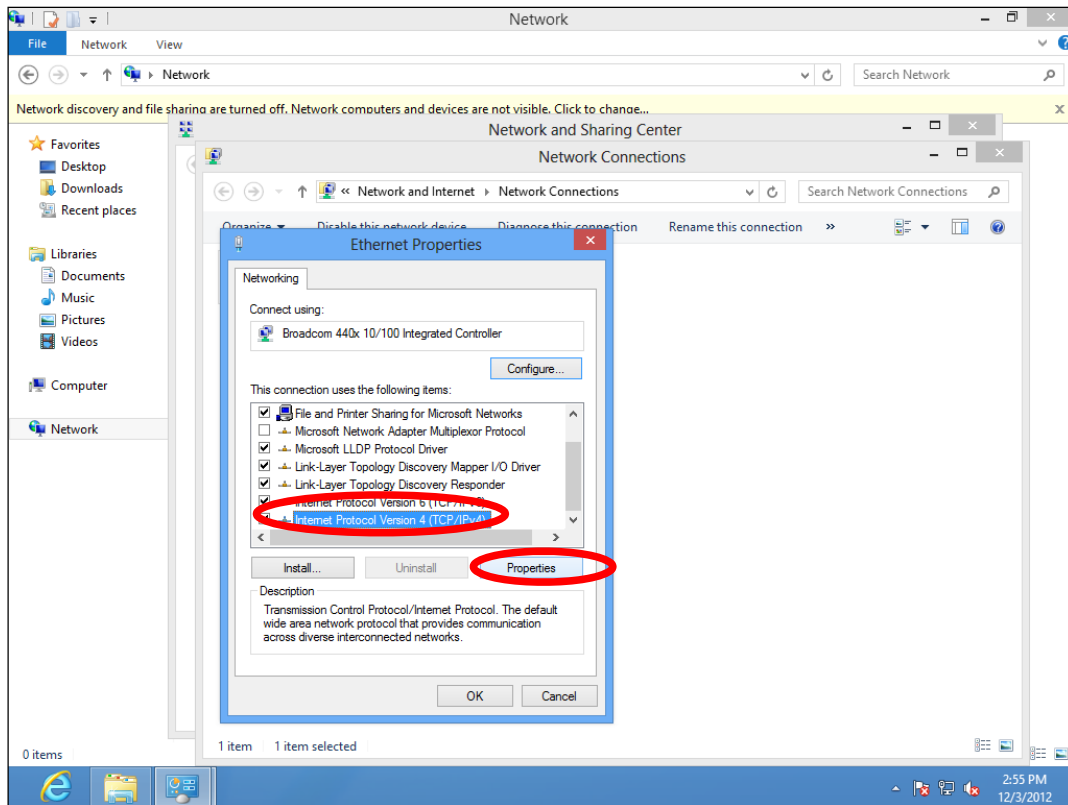

**4.** In the window that opens, select “Change adapter settings” from the left side.

5. Choose your connection and right-click, then select “Properties.”

6. Select “Internet Protocol Version 4 (TCP/IPv4),” then click “Properties.”

7. Select “Use the following IP address,” then input the following values:

**IP address:** 192.168.2.10

**Subnet mask:** 255.255.255.0

Click “OK” when finished.

## V-1-5. Mac

1. Have your Macintosh computer operate as usual, and click “System Preferences.”

2. In System Preferences, click “Network.”

3. Click “Ethernet” in the left panel.

4. Open the drop-down menu labeled “Configure IPv4” and select “Manually.”

5. Enter the IP address 192.168.2.10 and subnet mask 255.255.255.0. Click “Apply” to save the changes.

## V-1-6. Glossary

**Access Point:** An access point is an intelligent network device that forwards packets between different networks based on network layer address information, such as IP addresses.

**Default Gateway (Access point):** Every non-access point IP device needs to configure a default gateway's IP address. When the device sends out an IP packet, if the destination is not on the same network, the device has to send the packet to its default gateway, which will then send it out toward the destination.

**DHCP:** Dynamic Host Configuration Protocol. This protocol automatically gives every computer on your home network an IP address.

**DNS Server IP Address:** DNS stands for Domain Name System, which allows Internet servers to have a domain name (such as `www.Broadbandaccesspoint.com`) and one or more IP addresses (such as `192.34.45.8`). A DNS server keeps a database of Internet servers and their respective domain names and IP addresses, so that when a domain name is requested (as in typing "`Broadbandaccesspoint.com`" into your Internet browser), the user is sent to the proper IP address. The DNS server IP address used by the computers on your home network is the location of the DNS server your ISP has assigned to you.

**DSL Modem:** DSL stands for Digital Subscriber Line. A DSL modem uses your existing phone lines to transmit data at high speeds.

**Ethernet:** A standard for computer networks. Ethernet networks are connected by special cables and hubs, and move data around at up to 10/100 million bits per second (Mbps).

**IP Address and Network (Subnet) Mask:** IP stands for Internet Protocol. An IP address consists of a series of four numbers separated by periods that identifies a single, unique Internet computer host in an IP network. Example: `192.168.2.1`. It consists of 2 portions: the IP network address and the host identifier.

The IP address is a 32-bit binary pattern, which can be represented as four cascaded decimal numbers separated by ".": `aaa.aaa.aaa.aaa`, where each "aaa" can be anything from 000 to 255, or as four cascaded binary numbers

separated by “.”: bbbbbb.bbbbbbb.bbbbbbb.bbbbbbb, where each “b” can either be 0 or 1.

A network mask is also a 32-bit binary pattern, and consists of consecutive leading 1’s followed by consecutive trailing 0’s, such as

11111111.11111111.11111111.00000000. Therefore sometimes a network mask can also be described simply as “x” number of leading 1’s.

When both are represented side by side in their binary forms, all bits in the IP address that correspond to 1’s in the network mask become part of the IP network address, and the remaining bits correspond to the host ID.

For example, if the IP address for a device is, in its binary form,

11011001.10110000.10010000.00000111, and if its network mask is 11111111.11111111.11110000.00000000, it means the device’s network address is 11011001.10110000.10010000.00000000 and its host ID is 00000000.00000000.00000000.00000111. This is a convenient and efficient method for access points to route IP packets to their destination.

**ISP Gateway Address:** (see ISP for definition). The ISP Gateway Address is an IP address for the Internet access point located at the ISP's office.

**ISP:** Internet Service Provider. An ISP is a business that provides connectivity to the Internet for individuals and businesses or organizations.

**LAN:** Local Area Network. A LAN is a group of computers and devices connected together in a relatively small area (such as a house or an office). Your home network is considered a LAN.

**MAC Address:** MAC stands for Media Access Control. A MAC address is the hardware address of a device connected to a network. The MAC address is a unique identifier for a device with an Ethernet interface. It is composed of two parts: 3 bytes of data corresponding to the Manufacturer ID (unique for each manufacturer) plus 3 bytes often used as the product’s serial number.

**NAT:** Network Address Translation. This process allows all of the computers on your home network to use one IP address. Using the broadband access point’s NAT capability, you can access the Internet from any computer on your home network without having to purchase more IP addresses from your ISP.

**Port:** Network clients (LAN PC) uses port numbers to distinguish one network application/protocol from another. Below is a list of common applications and protocol/port numbers:

Application	Protocol	Port Number
Telnet	TCP	23
FTP	TCP	21
SMTP	TCP	25
POP3	TCP	110
H.323	TCP	1720
SNMP	UCP	161
SNMP Trap	UDP	162
HTTP	TCP	80
PPTP	TCP	1723
PC Anywhere	TCP	5631
PC Anywhere	UDP	5632

**Subnet Mask:** A subnet mask, which may be a part of the TCP/IP information provided by your ISP, is a set of four numbers (e.g., 255.255.255.0) configured like an IP address. It is used to create IP address numbers used only within a particular network (as opposed to valid IP address numbers recognized by the Internet, which must be assigned by InterNIC).

**TCP/IP, UDP:** Transmission Control Protocol/Internet Protocol (TCP/IP) and Unreliable Datagram Protocol (UDP). TCP/IP is the standard protocol for data transmission over the Internet. Both TCP and UDP are transport layer protocol. TCP performs proper error detection and error recovery, and thus is reliable. UDP, on the other hand, is not reliable. They both run on top of the IP (Internet Protocol), a network layer protocol.

**WAN:** Wide Area Network. A network that connects computers located in geographically separate areas (e.g., different buildings, cities, countries). The Internet is a wide area network.

**Web-based Management Graphical User Interface (GUI):** Many devices support a graphical user interface that is based on the Web browser. This means the user can use the familiar Netscape or Microsoft Internet Explorer to control/configure or monitor the device being managed.

## V-2. Hardware Specifications

MCU/RF	MediaTek MT7620A(2.4GHz) + QCA9882(5GHz)
PHY/Switch	Qualcomm Atheros AR8035
Memory	DDR2 64MB
Flash	8MB
Physical Interface	-LAN: 10/100/1000 Gigabit Ethernet with PoE support 802.3af (PD In) -Reset Button -DC Power Jack
Power Requirement	Power over Ethernet, IEEE 802.3af DC : 12V / 1A
Antenna	Internal PIFA Antenna (3dBi 2.4GHz x 2, 4dBi 5GHz x 2)
Others	Internal Buzzer (Find me)

## V-3. Enviornmental & Physical

Temperature Range	Operation : 0 to 40°C (32°F to 104°F) Storage : -20 to 60°C (-4°F to 140°F)
Humidity	90% or less – Operating, 90% or less - Storage
Certifications	FCC, CE
Dimensions	176(D) x 30(H)mm
Weight	306g

## **COPYRIGHT**

Copyright ©2015 IC Intracom. All rights reserved. ## **Federal Communication Commission Interference Statement**

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

1. Reorient or relocate the receiving antenna.
2. Increase the separation between the equipment and receiver.
3. Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
4. Consult the dealer or an experienced radio technician for help.

### **FCC Caution**

This device and its antenna must not be co-located or operating in conjunction with any other antenna or transmitter. This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation. Any changes or modifications not expressly approved by the party responsible for compliance could void the authority to operate equipment.

### **FCC Radiation Exposure Statement:**

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This equipment should be installed and operated with minimum distance 20cm between the radiator & your body.

### **R&TTE Compliance Statement**

This equipment complies with all the requirements of Directive 1999/5/EC of the European Parliament and the Council of March 9, 1999, on radio equipment and telecommunication terminal equipment and the mutual recognition of their conformity (R&TTE); and of its superseding Directive 2014/53/EU.

### **Safety**

This equipment is designed with the utmost care for the safety of those who install and use it. However, special attention must be paid to the dangers of electric shock and static electricity when working with electrical equipment. All guidelines of this and of the computer manufacture must therefore be allowed at all times to ensure the safe use of the equipment.
